** Students of fourth semester can choose the elective course from the list of elective courses provided below third and fourth semester.

Course Title: Mathematical Methods	L	T	P	Credits
Course Code: MTH 549	5	0	0	5

Objective: The objective of this paper is to introduce the concept of variation of functional and variational techniques. Two units are also devoted to acquaint the students with the applications of Laplace and Fourier Transform.

UNIT-I 15 HOURS

Functional and its properties, Variation of functional, proximity of curves, Motivational problems of calculus of variation, Fundamental lemma of calculus of variation, derivation of Euler's equation for one dependent variable and its alternative forms, invariance of Euler's equation under co-ordinate transformation; Shortest distance in a plane, Minimum surface of revolution, Brachistochrone problem, Geodesics.

UNIT-II 15 HOURS

Variational problems for functionals involving several dependent variables and higher order derivatives, functional involving functions of several independent variables, variational problems in parametric form, isoperimetric problems, Variational problems with moving boundaries- One end point is fixed and the other is movable, both the end points movable, Variational problem with a moving boundary for a functional dependent on two functions; Approximate solutions of Boundary Value Problem- Rayleigh-Ritz method.

UNIT-III 15 HOURS

Laplace Transform- Definition and sufficient conditions for its existence, basic properties of the Laplace transform, shifting theorems, Laplace transform of derivatives and integrals; Inverse Laplace transform- Definition and its uniqueness, shifting theorems, inverse Laplace transform of derivatives and integrals, the convolution theorem; Applications of Laplace Transform- Solution of ordinary differential equations and simultaneous ordinary differential equations, solution of boundary value problems.

UNIT-IV 15 HOURS

Fourier Transform-Introduction, Dirichlet's conditions, Fourier integral theorem, Fourier transform, inversion formula for inverse Fourier sine and cosine transform, relationship between Fourier and Laplace transform, the convolution for Fourier transform, Parseval's identity, Fourier transforms of derivatives and integrals, applications of infinite Fourier transforms to boundary value problems.

Course Title: Real Analysis
Course Code: MTH 550

L	T	P	Credits
5	0	0	5

Objective: The aim of this course is to make the students learn fundamental concepts of metric spaces and Riemann-Stieltjes integral as a generalization of Riemann Integral, the calculus of several variables and basic theorems.

UNIT-I   **15 HOURS**

Basic Topology: Finite, countable and uncountable sets, metric spaces, compact sets, perfect sets, connected sets.
Sequences and series: Convergent sequences, sub sequences, Cauchy sequences (in metric spaces), completion of a metric space.

UNIT-II   **15 HOURS**

Continuity: Limits of functions (in metric spaces), continuous functions, continuity and compactness, continuity and connectedness, monotonic functions.
The Riemann-Stieltjes integral: Definition and existence of the Riemann-Stieltjes integral, properties of the integral, integration of vector-valued functions.

UNIT-III   **16 HOURS**

Sequences and series of functions: Problem of interchange of limit processes for sequences of functions, Uniform convergence, Uniform convergence and continuity, Uniform convergence and integration, Uniform convergence and differentiation, Equicontinuous families of functions, Stone Weierstrass Theorem.

UNIT-IV   **14 HOURS**

Functions of several variables: Linear Transformations, Differentiation, The contraction principle, The Inverse function theorem. The implicit function theorem.

Reference Books:

1. Rudin, W. *Principles of Mathematical Analysis, 3rd Edition*. New Delhi: McGraw-Hill Inc., 2013.

2. Royden, H. L., and P. M. Fitzpatrick. *Real Analysis, 4th Edition.* New Delhi: Pearson, 2010.

3. Apostol, Tom. *Mathematical Analysis –A modern approach to Advanced Calculus*. New Delhi: Narosa Publishing House, 1957.

Course Title: Algebra-I	**L**	**T**	**P**	**Credits**
Course Code: MTH 552	**5**	**0**	**0**	**5**

Objective: This course provides the foundation required for more advanced studies in Algebra. The aim is also to develop necessary prerequisites for the course MTH 662.

UNIT-I   15 HOURS

Review of basic property of Groups: Subgroups and cosets, cyclic groups, normal subgroups and quotient groups, Isomorphism theorems. Dihedral groups. Symmetric groups and their conjugacy classes.

UNIT-II   15 HOURS

Simple groups and their examples, simplicity of An (n≥5). Normal and Subnormal Series, Derived Series, Composition Series and Solvable Groups.

UNIT-III   16 HOURS

Cauchy Theorem, Sylow's Theorems and their applications, Converse of Lagrange Theorem, Direct Products, Finite Abelian Groups, Invariants of a finite abelian groups, Groups of order $p2$, pq. Fundamental Theorem on Finitely generated Abelian Groups.

UNIT-IV   14 HOURS

Review of Rings, Ring Homomorphism, Ideals, and Algebra of Ideals, Maximal and prime ideals, Ideals in quotient rings, Field of Quotient of Integral domain.

Reference Books:

1. Bhattacharya, P. B., S. K. Jain, and S. R. Nagpaul, *Basic Abstract Algebra*, *2nd Edition.* U.K.: Cambridge University Press, 2004.

4. Dummit, David. S., and Richard M. Foote, *Abstract Algebra, 2nd Edition*. New Delhi: Wiley, 2008.

	L	T	P	Credits
Course Title: Linear Algebra	5	0	0	5
Course Code: MTH 553				

Objective: The concepts and techniques from linear algebra are of fundamental importance in many scientific disciplines. The main objective is to introduce basic notions in linear algebra that are often used in mathematics and other sciences. The emphasis will be to combine the abstract concepts with examples in order to intensify the understanding of the subject.

UNIT-I 15HOURS

Vector Spaces, Subspaces, Linear dependence, Basis and Dimensions, Algebra of Linear Transformation, Algebra of Matrices, Row rank, Column rank and their equality, System of Linear Equations.

UNIT-II 15HOURS

Eigen values and Eigenvectors, Characteristic and minimal polynomials, companion matrix, Cayley Hamilton Theorem, Matrix representation of Linear Transformation, Change of Basis, Canonical forms, Diagonal forms, triangular forms, Rational and Canonical Jordan Forms.

UNIT-III 15HOURS

Eigen spaces and similarity, Linear functional, Dual Spaces and dual basis, the double dual, Inner Product Spaces, Norms and Distances, Orthonormal basis, The Gram-Schmidt Orthogonalization, Orthogonal complements.

UNIT-IV 15HOURS

The Adjoint of a Linear operator on an inner product space, Normal and self-Adjoint Operators, Unitary and Normal Operators, Spectral Theorem, Bilinear and Quadratic forms.

Reference Books:

1. Lipschutz, S., and M. Lipson. *Linear Algebra, 3rd Edition*. New Delhi: Tata McGraw Hill, 2011.

2. Hoffman, K., and R. Kunze. *Linear algebra*, *2nd Edition.* New Delhi: Prentice Hall, 1971.

3. Axler, S. *Linear Algebra Done Right, 2nd Edition*. New York: Springer Verlag, 2004.

4. Lang, S. *Undergraduate Texts in Mathematics*, *3rd Edition*. New York: Springer-Verlag, 2004.

	L	T	P	Credits
Course Title: Complex Analysis	5	0	0	5
Course Code: MTH 555				

Objective: The objective of the course is to provide foundation for other related branches of Mathematics. Most of the topics covered are widely applicable in Applied Mathematics and Engineering.

UNIT-I   **15HOURS**

Complex plane, Stereographic projection, Riemann sphere, Function of complex variables, Continuity and Differentiability, Analytic functions, Conjugate function, Harmonic function, Cauchy Riemann equations (Cartesian and Polar form). Construction of analytic functions. Branch cut and Branch point.

UNIT-II   **15HOURS**

Complex line integral, Cauchy's theorem, Cauchy's integral formula and its generalized form. Cauchy's inequality. Poisson's integral formula, Morera's theorem. Liouville's theorem, conformal transformation, bilinear transformation, critical points, fixed points, Cross ratio problems.

UNIT-III   **15HOURS**

Meromorphic and entire function. Power series, Taylor's theorem, Laurent's theorem, Maximum modulus theorem (Principle), Schwarz's Lemma, poles and zeroes of meromorphic functions, Argumenta principle, and Fundamental theorem of Algebra and Rouche's theorem.

UNIT-IV   **15HOURS**

Zeros, Singularities, Residue at a pole and at infinity. Cauchy's Residue theorem, Jordan's lemma. Integration round Unit Circle. Evaluation of Integrals of the type $\int_C f(z)dz$ where $f(z)$ is a rational function with degree of denominator polynomial greater than that of numerator polynomial by at least two and C is a circle, $\int_0^{2\pi} f(\sin\theta, \cos\theta)d\theta$ and $\int_{-\infty}^{\infty} f(x)dx$.

6. Zill, D. G. and P. D. Shanahan. *A First Course in Complex Analysis with Applications*. Massachusetts: Jones and Bartlett Publishers, 2008.

L	T	P	Credits
5	0	0	5

Course Title: Theory of Measure and Integration
Course Code: MTH 556

Objective: The objective of this course is to study measure in an abstract setting after having studied Lebesgue measure on real line. The general **L^r**spaces are also studied.

UNIT-I   15HOURS

Lebesgue Measure: Introduction, Lebesgue outer measure, Measurable sets, Regularity, Measurable functions, Borel and Lebesgue measurability, Non-measurable sets. Littlewood's three principles.

UNIT-II   15HOURS

Lebesgue Integral: The Riemann integral, The Lebesgue integral of a bounded function over a set of finite measure, the integral of a non-negative function, The general integral, Convergence and measures.

UNIT-III   15HOURS

Differentiation and Integration: Differentiation of monotone functions, Functions of bounded variation, differentiation of an integral The Four derivatives, Lebesgue Differentiation Theorem. Absolute continuity. Convex Functions.

UNIT-IV   15HOURS

The L^P-spaces, Minkowski and Holder inequalities, Convergence and Completeness of L^P spaces, Approximations in L^P spaces, Bounded linear functional on the L^P spaces.

Reference Books:

1. Royden, H. L., and P. M. Fitzpatrick. *Real Analysis, 4th Edition.* New Delhi: Pearson, 2010.

2. Barra, G. de. *Measure Theory and Integration*. New Delhi: Woodhead Publishing, 2011.

	L	T	P	Credits
Course Title: Mathematical Statistics	5	0	0	5
Course Code: MTH 557A				

Objective: The course is designed to equip the students with various probability distributions and to develop greater skills and understanding of sampling distribution and hypothesis Testing.

UNIT-I   **15 HOURS**
Random Variables and Distribution Functions: Discrete and continuous random variables, Probability mass, Probability density and cumulative distribution functions, Joint, marginal and conditional distributions, Mathematical expectation, Variance and moments and Moment generating function.

UNIT-II   **15 HOURS**
Discrete probability distributions: Bernoulli, Binomial, Poisson, Geometric and Negative Binomial distributions and their properties.
Continuous probability distributions: Uniform, normal, beta distribution of first and second kind, gamma, exponential distributions and their properties.

UNIT-III   **15 HOURS**
Sampling Theory: Types of Sampling- Simple, Stratified, Systematic, Errors in sampling, Parameter and Statistics.
Exact Sampling Distributions: Chi-square distribution, Student's-t distribution, Snedecor's F-distribution, Fisher's – Z distribution.

UNIT-IV   **15 HOURS**
Hypothesis Testing*:* Tests of significance for small samples, Null and Alternative hypothesis, Critical region and level of significance, Tests of hypotheses: most powerful and uniformly most powerful tests, likelihood ratio tests. Tests of significance based on t, Z and F distributions, Chi square test of goodness of fit. Large Sample tests, Sampling of attributes, Tests of significance for single proportion and for difference of proportions, Sampling of variables, tests of significance for single mean and for difference of means and for difference of standard deviations.

Course Title: **Differential Geometry**	**L**	**T**	**P**	**Credits**
Course Code: **MTH 558**	**5**	**0**	**0**	**5**

Objective: The objective of this course is to provide knowledge of differential geometry of curves and surfaces in space, with special emphasis on a geometric point of view, as a basis for further study or for applications.

UNIT-I   **16 HOURS**

Curves, Arc length, Reparametrization, Level Curves vs Parametrized Curves, Curvature, Plane Curves, Space Curves, Simple Closed Curves, The Isoperimetric Inequality, The Four Vertex Theorem.

UNIT-II   **14 HOURS**

Surfaces in three dimensions: Surface, Smooth Surfaces. Tangents, Normals and Orientability. Quadric Surfaces. Triply Orthogonal Systems, Application of Inverse Function Theorem.

UNIT-III   **16 HOURS**

The First Fundamental Form: Lengths of Curves on Surfaces, Isometries of Surfaces. Conformal mappings of Surfaces, Surface Area. Equiareal maps and a Theorem of Archimedes. The Second Fundamental Form. The curvature of Curves on a Surface. The Normal and Principal Curvature. Geometrical interpretation of Principal Curvature.

UNIT-IV   **14 HOURS**

The Gaussian and Mean Curvatures. The Pseudosphere. Flat Surfaces. Sufaces of constant Mean Curvature. Gaussian Curvature of compact Surfaces. The Gauss Map. Geodesic Equations.

Reference Books:

L	T	P	Credits
4	0	0	4

Course Title: Numerical Analysis
Course Code: MTH 562

Objective: The objective of this course is to teach methods which are extremely useful in scientific research. The contents of the curriculum have been designed keeping in view the UGC guidelines.

UNIT-I 15 HOURS
Solution of non-linear equations: Review of Bisection, Regula-falsi and Secant methods, Functional Iteration method, Newton-Raphson method and its family, Muller's method. Rate of convergence of these methods. Simultaneous non-linear equations by Newton-Raphson method. Newton's method for complex roots and multiple roots.

UNIT-II 15 HOURS
Interpolation: Finite difference operators, divided differences, Newton's formulae for interpolation, Lagrange interpolation, Inverse interpolation, Hermite interpolation, cubic spline interpolation. Numerical differentiation.
Central Difference Interpolation Formulae: Gauss's central difference formulae, Stirling's formula.

UNIT-III 15 HOURS
Solution of Linear system of equations: Gauss-elimination method, Gauss-Jordan method, Factorization method. Concept of partial and complete pivoting.
Eigen Values and Eigen Vectors: Power method, Jacobi's method, Given's method, House-Holder's method.
Curve fitting (Method of Least squares): Linear and non-linear curve fitting, fitting of exponential curve.

UNIT-IV 15 HOURS
Numerical integration: Boole's rule, Weddle's rule. Romberg Integration. Numerical Double Integration.
Solution of Ordinary Differential Equations: Picard method of Successive approximations, Euler's method, Runge-Kutta method of order four, Predictor – Corrector methods: Milne's method, Adam's method, Finite Difference Method for boundary value problems (BVP), Shooting method for BVP.

Course Title: Numerical Analysis Lab	L	T	P	Credits
Course Code: MTH 563	0	0	4	2

Objective: Writing Programs in C/C++ /MATLAB for the problems based on the methods studied in theory paper and to run the Program on PC.

List of Practicals:

1. Matrix Multiplication
2. Newton-Raphson method and error analysis
3. Muller's method
4. Lagrange Interpolation
5. Numerical differentiation
6. Gauss-Jordan method
7. Factorization method
8. Power method for eigen value problem
9. Boole's Rule
10. Weddle's Rule
11. Double integration
12. Euler's method
13. Runge-Kutta method of order four
14. Predictor-Corrector methods
15. Shooting method

Course Title: Integral Equations-I	L	T	P	Credits
Course Code: MTH 660	5	0	0	5

Course Title: Integral Equations-I
Course Code: MTH 660

Objective: The objective of the course module is to study Integral Equations and to know that what is the relationship between the integral equations and ordinary differential equations and how to solve the linear and non-linear integral equations by different methods with some problems which give rise to Integral Equations.

UNIT-I   15 HOURS

Basic Concepts: Abel's Problem, Initial value problem, Boundary value problem, Integrals equations, Classification of integral equations, Iterated kernel, resolvent kernel, Eigenvalues and eigenfunctions, Solution of an integral equation, Applications to ordinary differential equations: Method of conversion of initial value problem to a Volterra integral equation, Boundary value problem and its conversion to Fredholm integral equation.

UNIT-II   15 HOURS

Fredholm Integral Equations: Introduction, The Adomian decomposition method, The Modified decomposition method, The variational iteration method, The direct computation method, The successive approximations method, The method of successive substitutions, Comparison between alternative methods, Solution of Fredholm Integral Equations of second kind with separable kernel.

UNIT-III   15 HOURS

Volterra Integral Equations**:** The Adomian decomposition method**,** the modified decomposition method**,** the variational iteration method**,** the series solution method**,** Converting Volterra equation to IVP**,** Successive approximations method**,** The method of successive substitutions**,** Comparison between alternative Methods.

UNIT-IV   15 HOURS

Volterra Integral Equations of the First Kind: The series solution method, Conversion of first kind to second kind, Resolvent kernel and Volterra Integral Equation, Fredholm's first theorem, working rule for evaluating the resolvent kernel and solution of Fredholm Integral Equation of second kind using Fredholm's first theorem, Fredholm's second fundamental theorem.

Reference Books:

Course Title: Topology	L	T	P	Credits
Course Code: MTH 661	5	0	0	5

Objective: The course is an introductory course on point-set topology so as to enable the reader to understand further deeper topics in topology like Differential/Algebraic Topologies etc.

UNIT-I   **15HOURS**

Topological Spaces: examples of topological spaces, the product topology, bases for a topology, the order topology, the box topology, the subspace topology, open sets, closed sets and limit points, continuous functions.

UNIT-II   **15HOURS**

The metric topology, the quotient topology, Connectedness: connected spaces, connected subspaces of the real line, components and path components, local connectedness.

UNIT-III   **14HOURS**

Compact spaces, compactness in metric spaces, local compactness, T_0, T_1, and T_2 spaces, One-Point Compactification.

UNIT-IV   **16HOURS**

Normal spaces, regular spaces, completely regular spaces, the Urysohn Lemma, countability axioms, Stone–Čech compactification, the Tietze Extension Theorem.

Reference Books:

    International, 1983.

	L	**T**	**P**	**Credits**
Course Title: Algebra-II	**5**	**0**	**0**	**5**
Course Code: MTH 662				

Objective: This course is a basic course in Algebra for students who wish to pursue research work in Algebra. Contents have been designed in accordance with the UGC syllabi in mind.

UNIT-I   **15HOURS**

Polynomial rings in many variables, factorization of polynomials in one variable over a field. Unique factorization domains, unique factorization in R[x], where R is a Unique Factorization Domain. Euclidean and Principal ideal domain.

UNIT-II   **15HOURS**

Gauss Lemma, Eisenstein's Irreducibility Criterion, Fields, Algebraic and Transcendental elements. The degree of a field extension, finite extensions.

UNIT-III   **15 HOURS**

Adjunction of roots. Splitting fields. Finite fields. Algebraically closed fields, separable and purely inseparable extensions. Perfect fields.

UNIT-IV   **15 HOURS**

Normal extensions, Galois extensions. The fundamental theorem of Galois Theory.

Reference Books:

	L	T	P	Credits
Course Title: Ordinary Differential Equations	5	0	0	5
Course Code: MTH 663				

Objective: The objective of this course is to equip the students with fundamental knowledge and problem solving skills in Power series methods of solution of ODE, Existence and Uniqueness theory of Initial Value Problems and Solution of system of differential equations.

UNIT-I   14HOURS

Review of fundamentals of Ordinary differential equations. The method of successive approximation. Initial value problem, Ascoli's Lemma, Gronwall's inequality, Cauchy Peano Existence Theorem, Picard's existence and uniqueness theorem, Lipschitz condition.

UNIT-II   16HOURS

Linear system of equations (homogeneous & non homogeneous). Superposition principle, Fundamental set of solutions, Fundamental Matrix, Wronskian, Abel Liouville formula, Reduction of order, Adjoint systems and Self Adjoint systems of second order. Linear 2nd order equations, preliminaries, Sturm's separation theorem, Sturm's fundamental comparison theorem.

UNIT-III   15HOURS

Orthogonal set of functions, Orthonormal set of functions, Gram-Schmidth process of orthonormalization, Sturm Liouville's boundary value problems, Orthogonality of Eigenfunctions and reality of Eigenvalues. Adjoint forms, Lagrange identity, Green function to solve boundary value problems.

UNIT-IV   15HOURS

Power series solution of differential equation about an ordinary point, Solution about regular singular points: The method of Frobenius, Applications, Legendre's, Hermite's and Bessel's equation. Ordinary differential equations in more than two variables: Simultaneous Differential equations of the first order and the first degree in three variables, Methods of their solution and applications.

Reference Books:

Course Title: Operations Research-I	**L**	**T**	**P**	**Credits**
Course Code: MTH 664	**5**	**0**	**0**	**5**

Objective: The objective of this course is to acquaint the students with the concept of convex sets, their properties and various separation theorems so as to tackle with problems of optimization of functions of several variables over polyhedron and their duals. The results, methods and techniques contained in this paper are very well suited to the realistic problems in almost every area.

UNIT-I   **15HOURS**

Operations Research and its Scope. Necessity of Operations Research in industry. Mathematical formulation of linear programming problem Linear Programming and examples, Convex Sets, Hyper plane, open and closed half-spaces, Feasible, Basic Feasible and Optimal Solutions, Extreme Point & graphical methods. Simple method, Charnes-M method, two phase method, Determination of Optimal solutions, unrestricted variables.

UNIT-II   **15HOURS**

Duality theory, Dual linear Programming Problems, fundamental properties of dual Problems, Complementary slackness, unbounded solution in Primal. Dual Simplex Algorithm, Sensitivity analysis.

UNIT-III   **15HOURS**

The General transportation problem, transportation table, duality in transportation problem, loops in transportation tables, linear programming formulation, solution of transportation problem, test for optimality, degeneracy, transportation algorithm (MODI method), time minimization transportation problem. Assignment Problems: Mathematical formulation of assignment problem, the assignment method, typical assignment problem, the traveling salesman problem.

UNIT-IV   **15HOURS**

Integer Programming: Pure and mixed Integer Programming Problems, Cutting plane techniques, Branch and Bound Technique.
Game Theory: Two-person zero sum games, maxmin-minmax principle, games without saddle points (Mixed strategies), graphical solution of $2 \times n$ and $m \times 2$ games, dominance property, arithmetic method of $n \times n$ games, general solution of $m \times n$ rectangular games.

Course Title: Fluid Mechanics-I
Course Code: MTH 665

L	T	P	Credits
5	0	0	5

Objective: The objective of this course is to introduce the fundamentals of modern treatment of incompressible and compressible fluid flows.

UNIT-I   **15HOURS**

Real fluids and ideal fluids, velocity of fluid at a point, streamlines, path lines, streak lines, velocity potential, vorticity vector, local and particle rates of change, equation of continuity, incompressible fluid flow, acceleration of fluid, conditions at a rigid boundary.

UNIT-II   **15HOURS**

Euler's equation of motion, Bernoulli's equation, their applications, some potential theorems, flows involving axial symmetry- stationary sphere in a uniform stream, impulsive motion, Kelvin's theorem of circulation, equation of vorticity.

UNIT-III   **16HOURS**

Some three dimensional flows: sources, sinks and doublets, images in rigid planes, images in solid spheres, Stoke's stream function.

UNIT-IV
14HOURS

Two dimensional flows: complex velocity potential, Milne Thomson circle theorem and applications, theorem of Blasius, Vortex rows, Karman Vortex Street.

Course Title: Discrete Mathematics	L	T	P	Credits
Course Code: MTH 666	5	0	0	5

Objective: The objective of this course is to acquaint the students with the concepts in Discrete Mathematics. It includes the topics like Logics, Graph Theory, Trees and Boolean algebra.

UNIT-I   **14 HOURS**

Basic logical operations, conditional and bi-conditional statements, tautologies, contradiction, Quantifiers, prepositional calculus, recursively defined sequences, the characteristic polynomial. Solution of recurrence relations, generating function.
Counting Techniques: The product rule, the sum rule, the inclusion–exclusion principle, The Pigeonhole Principle and examples. Simple arrangements and selections, Arrangements and selections with repetitions, Distributions, Binomial Coefficients.

UNIT-II   **16 HOURS**

Language and Grammars: Computability and Formal Languages, Ordered sets, languages, Phrase structure grammars, Types of grammars and languages, Finite state machines-equivalent machines, Finite state machines as language recognizers, Analysis of algorithm-Time complexity.

UNIT-III   **15 HOURS**

Introduction to Graph Theory: Basic Terminology, Special types of Graphs. The Handshaking Theorem, Paths and Circuits Shortest paths. Connectivity of Graphs. Isomorphism of Graphs. Homomorphism Graphs. Eulerian and Hamiltonian Graphs. Planar and Non Planar Graphs. Euler's formula. Graph Colouring. Adjacency and Incidence Matrices. Travelling Salesman
Problem.

UNIT-IV   **15 HOURS**

Trees: Basic Terminology. Binary Trees. Tree Traversing: Pre-order, Post-order and In-order Traversals. Minimum Spanning Trees, Prim's and Kruskal's Algorithm.
Boolean algebra, Boolean Function, Switching circuit and Logic Gates, K-map.
Lattice Theory: Lattices and Algebraic Structures, Lattice as algebraic structures, complete lattices, Sub-lattices, Homomorphism on lattices, Modular lattices.
.

L	T	P	Credits
5	0	0	5

Course Title: Functional Analysis
Course Code: MTH 667

Objective: The objective of this course is to introduce basic concepts, methods of Functional Analysis and its Applications. It is a first level course in Functional Analysis.

UNIT-I   14HOURS

Review of Metric spaces, Holder inequality and Minkowski inequality, Vector spaces with examples, Normed Spaces with examples $l^p, l^\infty, C[a,b]$ etc, Banach Spaces & Schauder Basis, Incomplete normed spaces, Finite Dimensional Normed Spaces and Subspaces, Equivalent norms, Compactness of Metric/ Normed spaces, Riesz's Lemma for two subspaces of a Normed space.

UNIT-II   16HOURS

Linear Operators- definition and examples, Range and Null space, Inverse Operator, Bounded and Continuous linear operators in a Normed Space, Bounded Linear Functionals in a Normed space with examples, Concept of Algebraic Dual and Reflexive space, Dual basis and Algebraic Reflexive space, Dual spaces with examples.

UNIT-III   17HOURS

Inner Product and Hilbert space, Further properties of Inner product spaces, Projection Theorem, Orthonormal Sets and Sequences, Fourier Series related to Orthonormal Sequences and Sets, Total Orthonormal Sets and Sequences, Separable Hilbert Spaces, Representation of functionals on a Hilbert Spaces (Riesz's Lemma and Representation), Hilbert Adjoint Operator, Self Adjoint, Unitary & Normal Operators.

UNIT-IV   13HOURS

Fundamental Theorems for Normed & Banach Spaces: Partially Ordered Set and Zorn's Lemma, Hahn Banach Theorem for Real Vector Spaces, Hahn Banach Theorem for Complex Vector Spaces and Normed Spaces, Baire's Category and Uniform Boundedness Theorems (Banach-Steinhaus Theorem), Open Mapping Theorem, Closed Graph Theorem, Adjoint Operator, Strong and weak convergence, Contraction Theorem.

	L	T	P	Credits
Course Title: Number Theory	5	0	0	5
Course Code: MTH 668				

Objective: The objectives of this course is to teach the fundamentals of different branches of Number Theory, namely, Geometry of Numbers and Analytic Number Theory.

UNIT-I   **15HOURS**

Divisibility of Integers, Greatest common divisor, Euclidean algorithm. The Fundamental theorem of Arithmetic, Congruences, Residue classes and reduced residue classes.

UNIT-II   **15HOURS**

Chinese remainder theorem, Fermat's little theorem, Wilson's theorem, Euler's theorem. Arithmetic functions σ(n), d(n), τ(n), μ(n), Order of an integer modulo *n*, primitive roots for primes, composite numbers having primitive roots, theory of indices.

UNIT-III   **15HOURS**

Quadratic residues, Legendre symbol, Euler's criterion, Gauss's lemma, Quadratic reciprocity law, Jacobi symbol. Perfect numbers, Characterization of even perfect numbers, Elementary results on the distribution of primes, Twin primes, Mersenne primes and Fermat numbers.

UNIT-IV   **15HOURS**

Representation of an integer as a sum of two and four squares. Diophantine linear equations $ax+by=c$, Diophantine non-linear equations $x^2 + y^2 = z^2$, $x^4 + y^4 = z^4$. Continued Fractions.

	L	T	P	Credits
Course Title: Partial Differential Equations	5	0	0	5
Course Code: MTH 670				

Objective: The objective of this course is to introduce the concepts of partial differential equations. To develop analytical techniques to solve partial differential equations. To understand the properties of solution of partial differential equations

UNIT-I   15HOURS

First Order linear and quasi Partial differential equations, method of Lagrange's, Integral surface through a given curve, Surface orthogonal to given system of surfaces. Nonlinear Partial differential equations of first order, Charpit's Method and Jacobi's Method, Cauchy problem for first order PDE's.

UNIT-II   15 HOURS

Partial Differential Equations of Second and Higher Order: Origin of second order partial differential equations. Higher order partial differential equations with constant coefficients. Equations with variable coefficients. Classification of second order partial differential equations. Canonical forms. Solution of non-linear second order partial differential equations by Monge's method.

UNIT-III   15HOURS

Method of Solution: Separation of variables in a PDE; Laplace, wave and diffusion equations, Elementary solutions of Laplace equations.

UNIT-IV   15HOURS

Applications of PDE: Wave equation, the occurrence of wave equations, elementary solutions of one dimensional wave equation; vibrating membranes, three dimensional problems. Diffusion equation, resolution of boundary value problems for diffusion equation, elementary solutions of diffusion equation.

Reference Books:

	L	**T**	**P**	**Credits**
Course Title: Operations Research-II	5	0	0	5
Course Code: MTH 671				

Objective: To acquaint the students with the concepts of convex and non-convex functions, their properties, various optimality results, techniques to solve nonlinear optimization problems and their duals over convex and non-convex domains.

UNIT-I **15HOURS**

Queuing Theory: Introduction, Queuing System, elements of queuing system, distributions of arrivals, inter arrivals, departure service times and waiting times. Classification of queuing models, Queuing Models**:** (M/M/1): (∞/FIFO), (M/M/1): (N/FIFO), Generalized Model: Birth-Death Process, (M/M/C): (∞/FIFO), (M/M/C) (N/FIFO).

UNIT-II **15HOURS**

Inventory Control: The inventory decisions, costs associated with inventories, factors affecting Inventory control, Significance of Inventory control, economic order quantity (EOQ), and Deterministic inventory problems without shortage and with shortages, EOQ problems with Price breaks, Multi item deterministic problems.

UNIT-III **15HOURS**

Network Analysis-Shortest Path Problem, Minimum Spanning Tree Problem, Maximum Flow Problem, Minimum Cost Flow Problem. Project scheduling by PERT/CPM: Introduction, Basic differences between PERT and CPM, Steps of PERT/CPM Techniques, PERT/CPM network Components and Precedence Relationships, Critical Path analysis, Probability in PERT analysis.

UNIT-IV **15HOURS**

Non Linear Programming –One and Multi Variable Unconstrained Optimization, Kuhn-Tucker Conditions for Constrained Optimization, Quadratic Programming, Separable Programming Convex programming. Non Convex Programming.

L	T	P	Credits
5	0	0	5

Course Title: Fluid Mechanics-II
Course Code: MTH 672

Objective: This course is designed to make the students learn to develop mathematical models of fluid dynamical systems and use mathematical techniques to find solutions to these models.

UNIT-I   16HOURS

Stress components in a real fluid, relation between Cartesian components of stress, rate of strain quadric and principal stresses, relations between stress and rate of strain, coefficient of viscosity and laminar flow.

UNIT-II   14HOURS

The Navier-Stokes equations of motion of a viscous fluid, steady motion of viscous fluid between parallel planes, steady flow through tube of uniform circular cross-section, flow through tubes of uniform cross section in the form of circle, ellipse and equilateral triangle.

UNIT-III   14HOURS

Diffusion of vorticity. Energy dissipation due to viscosity, steady flow past a fixed sphere, dimensional analysis, Reynolds numbers, Prandtl's boundary layer, Karman integral equation.

UNIT-IV   16HOURS

Elements of wave motion, waves in fluids, Surface gravity waves, standing waves, group velocity, energy of propagations, path of particles, waves at interface of two liquids.

	L	T	P	Credits
Course Title: Algebraic Topology	5	0	0	5
Course Code: MTH 673				

Objective: The aim of the unit is to give an introduction to algebraic topology. Algebraic Topology concerns constructing and understanding topological spaces through algebraic, combinatorial and geometric techniques. In particular, groups are associated to spaces to reveal their essential structural features and to distinguish them.

UNIT-I   **15HOURS**

The Fundamental group: Homotopy of paths, Homotopy classes, The Fundamental group, change of base point, Topological invariance, covering spaces, The Fundamental group of the circle.

UNIT-II   **15HOURS**

Retractions and fixed points, The Fundamental theorem of Algebra, The Borsuk - Ulam theorem, The Bisection theorem, Deformation Retracts and Homotopy type, Homotopy invariance.

UNIT-III   **15HOURS**

Direct sums of Abelian Groups, Free products of groups, uniqueness of free products, least normal subgroup, free groups, generators and relations, Van Kampen theorem, also classical version, The Fundamental group of a wedge of circles.

UNIT-IV   **15HOURS**

Classification of covering spaces: Equivalence of covering spaces, the general lifting lemma, the universal covering space, covering transformation, existence of covering spaces.

Course Title: Category Theory
Course Code: MTH 674

L	T	P	Credits
5	0	0	5

Objective: The objective of this course is to introduce the basic concepts of modern Category Theory.

UNIT-I 15HOURS

Categories: Introduction with Functions of Sets, Definition and examples of Categories: Sets, Pos, Rel, Mon, Groups, Top, Dis (X), Finite Category, Abstract Mappings, Additive Categories, The category of modules, The concept of functor and the category Cat, Functors of several variables. Isomorhism. Constructions: Product of two categories, The Dual Category, The Arrow Category, The Slice and Co- Slice Category.
Free Categories: Free Monoids and their Universal Mapping Property, The category Graphs, the category C (G) generated by a graph, Homomorphism of Graphs and the Universal Mapping Property of C (g).

UNIT-II 15HOURS

Abstract Structures: Epis and mono, Initial and Terminal objects, Generalized elements, Sections and Retractions, Product diagrams and their Universal Mapping Property, Uniqueness up to isomorphism, Examples of products: Product of Sets, Product in Cat, Poset, Product in Top. Categories with Products, Hom-Sets, Covariant representable functors, Functors preserving binary product.

UNIT-III 15HOURS

Duality: The duality principle, Formal duality, Conceptual duality, Coproducts, Examples in Sets, Mon, Top, Coproduct of monoids, of Abelian Groups and Coproduct in the category of Abelian Groups. Equalizers, Equalizers as a monic, Coequalizers, Coequalizers as an epic. Coequalizer diagram for a monoid.
Groups and Categories: Groups in categories, topological group as a group in Top. The category of groups, Groups as categories, Congruence on a category, quotient category and its univalent mapping property, finitely presented categories.

UNIT-IV 15HOURS

Limits and Co-limits: Subobjects, Pullbacks, Properties of Pullbacks, Pullback as a functor, Limits, Cone to a diagram, limit for a diagram, Co-cones and Colimits. Preservation of limits, contra variant functors. Direct limit of groups. Functors Creating limits and co-limits.

Reference Books:

1. Steven Awodey: Category Theory, (Oxford Logic Guides, 49, Oxford University Press.)

	L	T	P	Credits
Course Title: Classical Mechanics	5	0	0	5
Course Code: MTH 675				

Objective: The objective of this paper is to introduce classical mechanics with an emphasis on the understanding of the fundamentals. Lagrangian and Hamiltonian equations for dynamical systems are introduced at large. A small section is also devoted to rigid body dynamics.

UNIT-A   **15 HOURS**
Newton's laws of motion, its extensions to a system of particles and limitations; review of Work, power and energy; Constraints and their classification- Scleronomic and rheonomic, Holonomic and non-holonomic dynamical systems, conservative and dissipative, Examples of constraints; Virtual work- Virtual displacement, Principle of virtual work; D'Alembert's principle and its applications; Lagrangian formulation- Degrees of freedom, generalised coordinates, generalized force, generalized velocity, Expression of kinetic energy using generalized velocity, Lagrange's equation of motion, simple applications of the Lagrangian formulation.

UNIT-B   **15 HOURS**
Cyclic coordinates, Generalized momenta, conjugate momenta; Conservation theorems- conservation of linear momentum, conservation of angular momentum, conservation of energy; Hamilton's principle and Principle of least action, Difference between these principles, solving problems using these principles, Lagrange's equation from Hamilton's principle and vice-versa. Hamiltonian formulation- Legendre's dual transformations and its extension to include passive variables.

UNIT-C   **15 HOURS**
Hamilton's function and Hamilton's equations of motion, properties of Hamiltonian, simple applications of the Hamiltonian equations of motion, Routhian function and its use; Canonnical transformation, Properties of generator functions, Poisson bracket- Jacobi identity for Poisson bracket, Poission's theorem, Hamilton's equation in Poisson bracket. Invariance of Lagrange and Poisson brackets under canonical transformation.

UNIT-D   **15 HOURS**
Action-angle variables, Hamilton-Jacobi equation, Solution of H-J equation by method of separation of variables, Examples. Angular momentum of a rigid body, Kinetic energy of rotating body, Euler's dynamical equations, Symmetric top, Stability of vertical top. Eulerian angles.

L	T	P	Credits
5	0	0	5

Course Title: Integral Equations-II
Course Code: MTH 676

Objective: The objective of the course module is to study Integral Equations and to know that what is the relationship between the integral equations and ordinary differential equations and how to solve the linear and non-linear integral equations by different methods with some problems which give rise to Integral Equations.

UNIT-I   **15 HOURS**

Fredholm Integro-Differential Equations: Introduction, Fredholm Integro-Differential Equations, The Direct Computation Method, The Adomian Decomposition Method, The Modified Decomposition Method, The Noise Terms Phenomenon, The Variational Iteration Method, Converting to Fredholm Integral Equations.

UNIT-II   **15 HOURS**

Volterra Integro-Differential Equations: Introduction, Volterra Integro-Differential Equations, The Series Solution Method, The Adomian Decomposition Method, The Variational Iteration Method, converting to Volterra Integral Equation, Converting to Initial Value Problems, Volterra in taro-Differential Equations of the First Kind.

UNIT-III   **15 HOURS**

Nonlinear Fredholm Integral Equations: Introduction, Nonlinear Fredholm Integral Equations of the Second Kind, The Direct Computation Method, The Adomian Decomposition Method, The Variational Iteration Method, Nonlinear Fredholm Integral Equations of the First Kind, The Method of Regularization, Nonlinear Weakly-Singular Fredholm Integral Equations, The Modified Decomposition Method.

UNIT-IV   **15 HOURS**

Nonlinear Volterra Integral Equations: Introduction, Nonlinear Volterra Integral Equations of the Second Kind, The Series Solution Method, The Adomian Decomposition Method, The Variational Iteration Method, Nonlinear Volterra Integral Equations of the First Kind, The Series Solution Method, Conversion to a Volterra Equation of the Second Kind, Nonlinear Weakly-Singular Volterra Integral Equations, The Modified Decomposition Method.
